Programme Highlight

This training course consists of two topics. The first topic is the fire safety engineering in heritage buildings in Hong Kong. Preservation and revitalisation of heritage buildings is the recent hot topic in Hong Kong. The designs of these buildings may not comply to the current statutory requirement and the heritage features of the buildings should be retained in exercise of preservation and revitalisation. Performance-based fire engineering provides a promising approach to the engineers to tackle the problems. We have invited officers from Fire Services Department and Buildings Department to share with us the design considerations and approaches via different case studies in two evening lectures. It is a good opportunity for experience sharing and learning the practical approaches for these projects. The other two lectures of this training course are designed to provide information to young engineers on the design, installation, testing and commissioning of smoke management systems in buildings including air ventilation control system, staircase pressurization system, smoke extraction system, etc. Experienced consultants and contractors have been invited to deliver the theories, design practices and problem encountered in installation and test and commissioning of the systems. Young engineers are encouraged to join the training course to gain more technical knowledge in this area from the speakers.
